

Quick pit NW Passage apron

Date

Fri, 11/29/2024 - 14:30

Activity

Skiing

Went up the apron today and out to the ski area boundary. The skiing is still excellent, and there were tracks everywhere!

Dug a quick pit at 8000', NE aspect, ~30deg slope

Total Height of snow: 80cm

The snowpack is generally in quite good shape for this time of year. Right side up and wet snow at the ground! No primary layer of concern where I dug and the new snow seems to be bonding well. Because of this I did not perform any stability tests.

Calm winds, overcast skies and balmy temps are most likely helping heal any wind slabs at upper elevations.

One more note: It looked like a D2 propagated in Argentina Bowl. Observed on the drive in

Region

Bridger Range

Location (from list)

Bridger Bowl
