## **Reactive Storm Slabs on Mount Ellis**

Mt Ellis Northern Gallatin 2/5/2025 Code SS-N Latitude 45.57770 Longitude -110.95500 Notes

Skied big Ellis this morning. The temperature inversion was still active but not as dramatic as yesterday. The snow in the warm zone, near the top, of the inversion was well bonded and clearly affected by warmer temps. It was snowing hard up there but coming down as <u>graupel</u>. In the cold zone of the inversion the new snow was extremely active. We were remote triggering every small slope we passed on the gully exit. We saw many naturals breaking on any large open slope in the gully. The snow on the cold side of the inversion was blower but not bonding well at all. Could be a very sketchy setup if you find your self skiing in avy terrain that stayed cold over the last few days.
